

# Homogeneous Dispersible Fertilizer

## Best possible distribution of granular nutrients

N-Fusion™ homogeneous fertilizer provides uniform coverage for exceptionally even turf growth and response. N-Fusion™ revolutionary dispersing fertilizer technology minimizes mower pick-up with a short irrigation cycle. N-Fusion™ utilizes special binding agents that react with water to release the nutrients through the turf canopy into the root zone. N-Fusion™ guarantees premium results where needed most.

## Turf Benefits

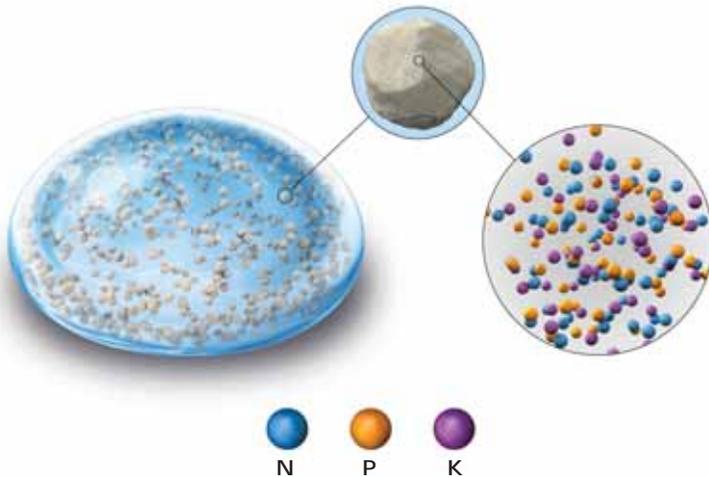

- N-Fusion™ superior distribution of nutrients due to the small particle sizing is further enhanced by the dispersion of the nutrients with light irrigation or rainfall.
- N-Fusion™ homogeneous fertilizer provides uniform coverage due to a high uniformity index (UI).
- Highly visible granules allow for ease of application.
- N-Fusion™ eliminates movement of particles with surface water and accumulation in lower areas of the playing surface.

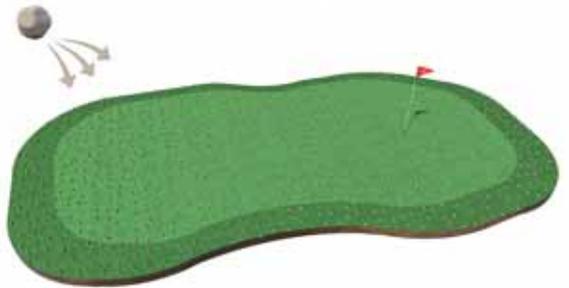

## How it works

### Dispersible Fertilizer Technology

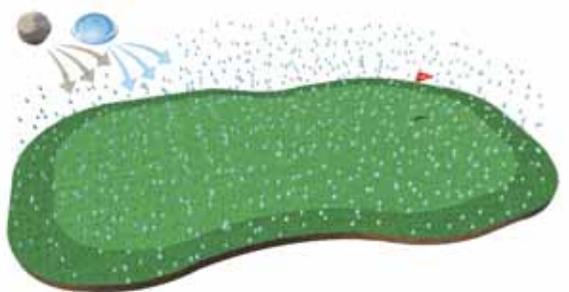

The N-Fusion™ technology utilizes special binding agents that maintain granule integrity from production through application. When acted upon by irrigation or rainfall the nutrients are released and penetrate the turf canopy. The distribution of nutrients is further enhanced by the micro particle sizing.

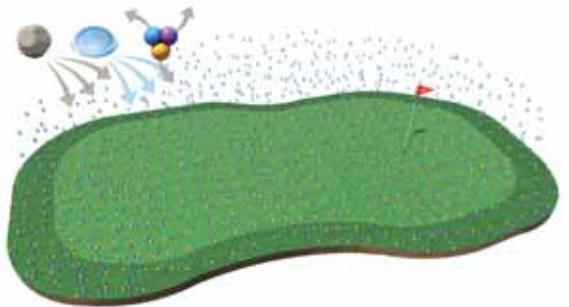

### Step 1 - Easy application and exceptional uniformity

### Step 2 - Activate dispersion with water

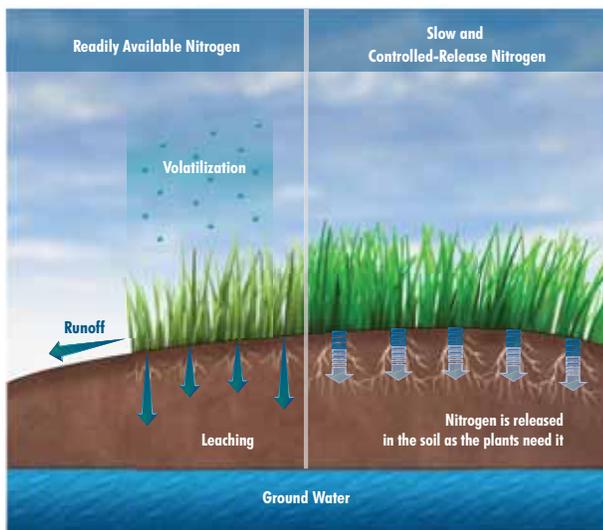

### Step 3 - Optimum nutrient distribution and results

## Environmental Benefits

N-Fusion™ homogeneous granules distribute nutrients evenly over the entire area allowing for more precise turfgrass response. This results in fewer inputs, consistent growth and better playing conditions and ultimately reduces the carbon footprint of a turf management operation.

## Products available

- 17-0-20 N-Fusion™ Micro - 65% Methydure®
- 17-0-17 N-Fusion™ Micro - Isodure™
- 16-2-12 N-Fusion™ Micro - 65% UMAXX® / 25% Isodure™
- 13-3-12 N-Fusion™ Micro Starter - 100% AS
